"Characterization of the 3' end of the pig sarcoplasmic/endoplasmic-
reticulum Ca2+ pump gene 2.";

Biochin. Biophys. Acta 1088:448-451(1991).

-1 FUNCTION: THIS MAGNESIUM DEPENDENT ENZYME CATALYZES THE HYDROLYSIS

OF ATP COUPLED WITH THE TRANSLOCATION OF CALCIUM FROM THE CYTOSOL

TO THE SARCOPLASMIC RETICULUM LUMEN. ISOFORM SERCA2A IS INVOLVED

IN THE REGULATION OF THE CONTRACTION/RELAXATION CYCLE (BY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      -!- ENZYME REGULATION: REVERSIBLY INHIBITED BY PHOSPHOLAMBAN (PLN) AT LOW CALCIUM CONCENTRATIONS. DEPHOSPHORYLATED PLN DECREASES THE APPARENT AFFINITY OF THE ATPASE FOR CALCIUM. THIS INHIBITION IS REGULATED BY THE PHOSPHORIAMINON OF PLN (BY SIMILARITY).
-!- SUBUNIT: ASSOCIATED WITH PHOSPHOLAMBAN (PLN) (BY SIMILARITY).
-!- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN. SARCOPLASMIC AND ENDOLASMIC RETICULUM.
-!- ALTERNATIVE REDUCTS: 2 ISOFORMS; SERCAZA/ATP2AZA AND SERCAZB/ATP2AZB (SHOWN HERE); ARE PRODUCED BY ALTERNATIVE SPLICING IN A TISSUE-SPECIFIC MANNER.

Mutations in ArP2A2, encoding a Ca2+ pump, cause Darier disease.";
Nat. Genet. 21:271-277(1999).

-!- SINOTION: THIS MAGNESIUW DEPENDENT ENZYME CATALYZES THE HYDROLYSIS
OF ATP COUPLED WITH THE TRANSLOCATION OF CALCIUW FROM THE CYTOSOL
TO THE SARCOPLASMIC RETICULUM LUMEN. ISOFORM SERCA2A IS INVOLVED
IN THE REGULATION OF THE CONTRACTION/RELAXATION CYCLE.

-!- CATALYTIC ACTIVITY: ATP + H(2)O + CA(2+)(IN) = ADP + PHOSPHATE +
CA(2+)(OUT).

LOW CALCIUM CONCENTRATIONS. DEPHOSPHORYLATED PLN DECREASES THE
REGULATED BY THE PHOSPHORYLATION OF PLN (BY SIMILARITY).

-!- SUBGUIT: ASSOCIATED WITH PHOSPHORYLAND (PLN) (BY SIMILARITY).

-!- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN. SARCOPLASMIC AND ENDOPLASMIC RETICULUM.

-!- ALTERNATIVE PRODUCTS: 2 SECRAZA/ATPZAZA/CLASS 1/HK2 AND SERCAZB/ATPZAZB/CLASS 2 - 4/HK1 (SHOWN HERE); ARE PRODUCED BY ALTERNATIVE SPLICTING. SERCAZ TRANSCRIPTS DIFFER ONLY IN THEIR 3 UTR REGION AND ARE EXPRESSED IN A TISSUE-SPECIFIC ISOFORM AND SERCAZB IS A CARDIAC/SLOW TWITCH, MOSCLE SPECIFIC ISOFORM AND SERCAZB IS A UBIQUITOUS HOUSEKEEPING ISOFORM. SERCAZA HAS A LOWER AFFINITY FOR CALCIUM AND A HIGHER CATALYTCT TRUNOVER RATE.

-- TISSUE SPECIFICITY: ISOFORM SERCAZB IS WIDELY AND SLOW TWITCH SKELETAL MUSCLE. ISOFORM SERCAZB IS WIDELY EXPRESSED IN HEART AND SLOW TWITCH SKELETAL MUSCLE. ISOFORM SERCAZB IS WIDELY EXPRESSED. IN SMOOTH MUSCLE. ISOFORM SERCAZB IS WIDELY EXPRESSED. IN SMOOTH MUSCLE. ISOFORM SERCAZB IS WIDELY EXPRESSED.

FEBS Lett. 29:35-41(1989).
-!- FUNCTION: THIS MAGNESUM DEPENDENT ENZYME CATALYZES THE HYDROLYSIS
- PUNCTION: THIS MAGNESUM FROM THE TRANSLOCATION OF CALCIUM FROM THE CYTOSOL
TO THE SARCOPLASMIC RETICULUM LUMEN. ISOFORM SERCAZA IS INVOLVED
IN THE REGULATION OF THE CONTRACTION/RELAXATION CYCLE (BY
SIMILARRITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CA(2+)(OUT).

ENZYME REGULATION: REVERSIBLY INHIBITED BY PHOSPHOLAMBAN (PLN) AT LOW CALCIUM CONCENTRATIONS. DEPHOSPHORYLATED PLN DECREASES THE APPARENT AFFINITY OF THE ATPASE FOR CALCIUM. THIS INHIBITION IS REGULATED BY THE PHOSPHORYLATION OF PLN (BY SIMILARITY).
SUBDUNIT: ASSOCIATED WITH PHOSPHORAMBAN (PLN) (BY SIMILARITY).
SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN. SARCOPLASMIC AND ENDOPLASMIC RETICULUM.
ALTERNATIVE PRODUCTS: 2 ISOFORMS; SERCAZA/ATPZAZA AND SERCAZB/ATPZAZB (SHOWN HERE); ARE PRODUCED BY ALTERNATIVE SPLICING IN A TISSUE-SPECIFIC MANNER (BY SIMILARITY).
TISSUE-SPECIFIC MANNER (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                stomach is encoded
                                                                                                                         (CALCIUM PUMP 2) (SERCA2) (SR CA(2+)-ATPASE 2) (CALCIUM-TRANSPORTING ATPASE SARCOPLASMIC RETICULUM TYPE, SLOW TWITCH SKELETAL MUSCLE ISOFORM) (ENDOPLASMIC RETICULUM CLASS 1/2 CA(2+) ATPASE).

Mamm. Genome 11:159-163(2000).
-!- FUNCTION: THIS MAGNESIUM DEPENDENT ENZYME CATALYZES THE HYDROLYSIS
OF ATP COUPLED WITH THE TRANSLOCATION OF CALCIUM FROM THE CYTOSOL
TO THE SARCOPLASMIC RETICULUM LUMEN. ISOFORM SERCAZA IS INVOLVED
IN THE REGULATION OF THE CONTRACTION/RELAXATION CYCLE (BY
SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    LOW CALCTUM CONCENTRATIONS. DEPHOSPHORYLATED PLAN DECREASES THE APPARENT AFFINITY OF THE ATPASE FOR CALCTUM. THIS INHIBITION IS SEGULATED BY THE PHOSPHORYLATION OF PLAN (BY SIMILARITY).
SUBGUILT: ASSOCIATED WITH PHOSPHOLAMBAN (PLAN) (BY SIMILARITY).
SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN. SARCOPLASMIC AND ALTERNATIVE PRODUCTS: 2 ISOFORMS; SERCAZA/ATPZAZA AND SERCAB/ATPZAZB (SHOWN HERE); ARE PRODUCED BY ALTERNATIVE SPLICING IN A TISSUE-SPECIFIC MANNER.

AND SLOW TWITCH SKELETAL MUSCLE. ISOFORM SERCAZB IS HIDELY
                                                                                                                                     ATC2_MOUSE STANDARD; PRT; 1044 AA.

Drug screening using DC-STAMP or its fragments can be performed to identify compounds having binding affinity to or other relevant isolation effects on the function of DC-STAMP. The DC-STAMP can also be used in diagnostic kits and methods for detecting the presence of another DC-STAMP or binding partner.
                                                                                                                                                                                                                                                                                                   New mammalian proteins designated dendritic cell specific transmembrane protein and DNAX surface protein and the nucleic acids encoding the
                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is human dendritic cell specific transmembrane protein (DC-STAMP). The DC-STAMP is useful in forensic sciences, e.g. to distinguish rodent from human or as a marker to distinguish between different cells exhibiting differential expression or modification patterns. The DC-STAMP and its antibodies are used for preparing kits for use in molecular biology, immunology or physiology, and in treatment of conditions associated with abnormal physiology or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  240

AAF91858-AAF91929 represent cDNAs corresponding to 52 human secreted protein genes, and AAB87342-AAB87413 represent the proteins they encode. AAB87414-AAB87454 represent human secreted protein fragments. The genes and their corresponding secreted proteins are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 52 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haematopoletic disorders, diseases of the immune system, AIDS, autoimmune diseases (e.g., rheumatoid arthritis), inflammation,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DXAX
                                                                                                                                                                                                       1;
disorders, and infections. The proteins can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues, to identify their as a food additive or binding partners, and in chemotaxis, and can be used Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassays e.g., radioimmunoassay or enzyme linked immunosorbent assay (ELISA). The present sequence represents a human secreted protein of the invention.
                                                                                                                                                                                                                                                                                                                                      LSSLGQKLLAFAGLSLVLLGTGLFMKRFLGPCGWKYENIYITRQFVQFDERERHQQRPCV 266

The polypucientae sequences given in AACOSYON to AACOSYON to AACOSYON to AACOSYON to AACOSYON to AACOSYON to AACOSYON to AACOSYON them, which are given in the exemplification of the present invention. Human secreted proteins have activities based on the tissues controlled them, which are given in the exemplification of the present invention. Human secreted proteins have activities based on the tissues and cells the genes are expressed in. Examples of activities include: cytostatic; immunosuppressive; nootropic; neuroprotective; antiviral; antialergic; hepatotropic; antidiabetic; antiinflammatory; antiulcer; cytostatic; immunosuppressive; nootropic; neuroprotective; antiviral; antialergic; hepatotropic; antidiabetic; antiinflammatory; antiulcer; cytostatic; and polypuclectial; antifungal; antiparasitic; and cardiant. The polynucleotides and polypeptides are useful for cardiant. The polynucleotides and polypeptides are useful for consess, cards, dogs, chickens or sheep. The polypucleotides are polypeptides can also be used as a food additive or preservative to thorwasome identification. They are also useful as probes for diagnosing a disorder related to the female reproductive system, crepatically preast and ovary cancer. They are also useful in the gene therapy of breast and ovary cancer. New are also useful in the gene condisions and antagonists from the present invention are useful in the cardiovascular disorders, wound healing, neurological diseases and infectious disease. AACS9957 to AACS9955 and AAB34772 represents sequence condisions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              'n
Fifty nucleic acid molecules encoding human secreted proteins, useful in the prevention, treatment and diagnosis of cancer, immune disorders, cardiovascular disorders and neurological diseases -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The polynucleotide sequences given in AAC59966 to AAC60015 encode the

Nucleic acids encoding 50 human secreted polypeptides, useful for preventing, diagnosing and/or treating diseases, e.g. Parkinson's disease, botulism, cancers and Scimitar syndrome -

Claim 11; Page 535-536; 614pp; English.

And the protein the protein the proteins they encode. Are Andro8394 represent cDNAs corresponding to 50 human secreted protein fragments they encode. Andro3364 -Andro3369 represent human secreted protein fragments or variants. The genes and their secreted proteins are useful for preventing. The genes and their secreted proteins are useful for preventing. The genes and their secreted proteins are useful for preventing. The genes and their secreted proteins are useful for preventing. The genes and their secreted proteins are useful for preventing the amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 50 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, feetal and developmental about a lisases (e.g., rheumatold arthritis), inflammation, allergies, neurological disorders, diseases of the immune system, allergies, neurological disorders, schizophrenia, asthma, allergies, neurological disorders, schizophrenia, asthma, allergies, neurological disorders, schizophrenia, atherosclerosis, cardiovascular disorders, pregnancy-related disorders, endocrine disorders, and infections. The proteins can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting colluture of primary tissues, to regenerate tissues, to identify their cognate ligands or binding partners, and in chemotrasis, and and can be used as a food additive or preservative to modify storage properties. Antibodies specific for a protein of the invention can be used in allegonate issues, to readence represents a human secreted protein of the invention. variants.

inflammation; allergy; neurological disorder; Alzheimer's disease;
 treating or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 52 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haematopoietic disorders, diseases of the immune system, AIDS, autoimmune diseases (e.g., rheumatoid arthritis), inflammation, allergies, neurological disorders, schizophrenia, asthma, allergies, neurological disorders, schizophrenia, asthma, skin disorders (e.g., psoriasis), sepsis, diabetes, atheroscierosis, cardiovascular disorders, angiogenic disorders, kidney disorders, edisorders, and infections. The proteins can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to subburn, to maintain organs before transplantation for supporting cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                              AAF91858-AAF91929 represent cDNAs corresponding to 52 human secreted protein genes, and AAB87342-AAB87413 represent the proteins they encode. AAB87414-AAB87454 represent human secreted protein fragments. The genes and their corresponding secreted proteins are useful for preventing,
                                                                                                                                                                                                                                                                                                                                                                                                                     culture of primary tissues, to regenerate tissues, to identify their cognate ligands or binding partners, and in chemotaxis, and can be used as a food additive or preservative to modify storage properties. Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           foetal abnormality; developmental abnormality; haematopoietic disorder; immune system disorder; AIDS; autoimmune disease; rheumatoid arthritis;

AAF91858-AAF91929 represent cDNAs corresponding to 52 human secreted protein genes, and AAB87342-AAB87413 represent the proteins they encode. AAB87414-AAB87454 represent human secreted protein fragments. The genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acid molecules encoding human secreted proteins, used in preventing, treating or ameliorating a disorder, e.g. Alzheimer's and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   in diagnostic immunoassays e.g., radioimmunoassay or enzyme linked immunosorbent assay (ELISA). The present sequence represents a human secreted protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

AAB87414-AAB87424 represent human secreted protein fragments. The genes and their corresponding secreted proteins are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the

amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 52 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haematopoietic disorders, diseases of the immune system, ALDS, autoimmune diseases (e.g., Pheumatoid arthritis), inflammation, allergies, neurological disorders (e.g., Alzheimer's disease, strin disorders (e.g., psoriasis), sepsis, diabetes, atherosclerosis, skin disorders (e.g., psoriasis), sepsis, diabetes, atherosclerosis, cardiovascular disorders, angiogenic disorders, kidney disorders, of astrointestinal disorders, pregnancy-related disorders, endocrine disorders, and infections. The proteins can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues, to identify their and the distribution of the supporting and the distribution of the supporting and the distribution of the supporting and the distribution of the supporting and the distribution of the supporting and the distribution of the supporting and the distribution of the supporting and the distribution of the supporting and the distribution of the supporting and the distribution of the supporting and the distribution of the supporting and the distribution of the supporting and the distribution of the supporting and the distribution of the supporting and the distribution of the supporting and the distribution of the supporting and the distribution of the supporting and the distribution of the supporting and the distribution of the supporting the supporting and the supporting and the supporting and the supporting and the supporting and the supporting and the supporting and the supporting and the supporting and the supporting and the s

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                as a food additive or preservative to modify storage properties.
Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassays e.g., radioimmunoassay or enzyme linked immunosorbent assay (ELISA). The present sequence represents a human secreted protein fragment referred to in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; secreted protein; proliferative disorder; cancer; tumour; foctal abnormality; developmental abnormality; haematopoietic disorder; immune system disorder. treating or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of amount of the new protein in a sample or by determining the presence of amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 52 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of and include developing products for the diagnosis or treatment of a proliferative disorders, cancer, tumours, focatal and developmental abnormalities, haematopoietic disorders, disease of the immune system, AIDS, autoimmune diseases (e.g., rheumatoid arthritis), inflammation, allergies, neurological disorders (e.g., Albeimer's disease, Parkinsons's disease), cognitive disorders, schizophrenia, asthma, skin disorders (e.g., psoriasis), sepsis, diabetes, atherosclerosis, cardiovascular disorders, pregancy-related disorders, endocrine disorders, and infections. The proteins can also be used to aid wound subdurance of primary tissues, to regenerate tissues, to identify their cognate ligands or binding partners, and in chemotaxis, and can be used as a food additive or preservative to modify storage properties.

Antibodies specific for a protein of the invaption can be used in diagnostic immunosassays e.g., radioimmunoassay or enzyme linked immunosorbent assay (Elisa). The present sequence represents a human secreted protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAF91858-AAF91929 represent cDNAs corresponding to 52 human secreted protein genes, and AAB8742-AAB87413 represent the proteins they encode. AAB87414 AAB87454 represent human secreted protein fragments. The genes and their corresponding secreted proteins are useful for preventing,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acid molecules encoding human secreted proteins, used in preventing, treating or ameliorating a disorder, e.g. Alzheimer's and Parkinson's diseases and cancers -

```
This invention describes novel human genes and the secreted proteins they encode. The polynucleotides and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polypeptides in a cample or by determining the presence of mutations in the new polypeptides in a polynucleotides. Specific uses are described for each of the polynucleotides of the invention, based on which tissues they are most polynucleotides of the invention, based on which tissues they are most treatment of cancer, tumors, neurodegenerative disorders, developmental abnormalities, blood disorders, leukemias, diseases of the immune system, autoimmune diseases, hepatic and renal diseases, inflammation, allergies, alrections, AIDS, transplant rejection, diabetes, asthma, sepsis, acne, polypeptides or polynucleotides can also be used as food additives or polypeptides can also be used as food additives or binding partners. AAY45257-Y45289 represent the human secreted proteins
                                                                                                                                                                                                                                                                                                                                                                                                         Secreted protein; human; gene therapy; diagnosis; treatment; cancer; protein therapy; tumor; neurodegenerative disorder; blood disorder; AIDS; developmental abnormality; leukemia; immune system; autoimmune disease; hepatic disease; renal disease; inflammation; allergy; schizophrenia; Alzheimer's disease; cognitive disorder; arthritis; infection; psoriasis; transplant rejection; diabetes; asthma; sepsis; acne; metabolic disorder; cardiovascular disorder; food additive; preservative.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ب

AAY54065-74 represent enzymes involved in the biosynthesis of exopolysaccharides (EPS). These enzymes are designated EPS1-EPS10, and are encoded by open reading frames eps1-eps10. The enzymes are isolated from Streptococcous thermophilus strain Sfi39. The proteins are used in a method for the synthesis of EPS, which includes at least one step of forming a bond (alpha or beta-isomer) between C-1 (carrying the reducing aldehyde function, of an activated D-galactose pyranose), and a phosphate on a lipophilic or proteinaceous primer. Stepwise synthesis of EPS occurs with, in each step, addition of a new sugar unit, through its hemi-acetyl function, to an alcoholic hydroxyl of a second sugar unit, present at the end of a chain of sugar residues bonded to the '
                                                                                                                                                                                                                                                                                                                                                                                   Exopolysaccharide; EPS; ESP enzyme; EPS1; EPS2; EPS4; EPS5; EPS6; EPS6; EPS6; EPS9; EPS9; EPS10; Streptococcus thermophilus strain Sfi39; activated D-galactose pyranose; saccharide; beta-glycosyltransferase; transporter; food; fermented milk product; yoghurt; cheese; flavour stability; organoleptic property.

primer. EPS1 to EPS4 are used to elongate the EPS chain, and to regulate EPS production, EPS5 creates new bonds between saccharides, EPS6 is used in the biosynthesis of EPS9, EPS7 and EPS8 are beta-glycosyltransferases, EPS9 is a transporter of repetitive units, and EPS10 catalyses the conversion of a pyranose form of a beta-D-galactose to the furanose form. The EPS enzyme are used to improve properties of foods, particularly fermented milk products such as yoghurt and cheese, e.g. their organoleptic properties and flavour stability.

AAY43767-76 represent the proteins encoded by the eps operon of streptcoccus thermophilus Sfi39. The operon contains 10 open reading frames, and encodes enzymes (eps1, eps2, eps3, eps4, eps5, eps6, eps7, eps8, eps9 and eps10, that are involved in the biosynthesis of exopolysaccharides (EPS). The enzymes catalyse the formation of specific intersugar bonds. The enzymes catalyse a process that includes at least one step of forming a bond (in alpha or beta anomaric form) between C1, carrying the reducing aldehyde group of an activated D-Galp (galactose in pyranose form), and a phosphate group on a lipophilic or proteinaceous primer. The enzymes are used to produce EPS that have antitumor or probiotic properties or are used in foodstuffs to improve organization or problem of alavour. When expressed by lactic acid bacteria, EPS impart a free-flowing character and/or a smooth, creamy exture to acidified milk products (yoghurt or cheese).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               15;
